04.File Permissions

Sunday, March 15, 2026 3:37 PM

- ls -l long listing, showing the files with their metadata
- chmod +x make a file executable
  → now it can be run with ./script.sh

#! - shebang
- instruction for the operating system
- defines the interpreter

Here, #! /usr/bin/env bash

! A bash script does not need an extension (it can be script, script.sh, script.bash
