06.Process Substitution

Sunday, March 15, 2026 3:38 PM

grep -c text file counts how many times the text showed in file

! Without quoting a variable, a working for loop is probably wrong (heuristics)

<(...) for process substitution
>(...) reverse the way it works

Here string - pipe data into a command that already exists into an variable that you already have

```
while read -r word; do
        echo "$ word"
        (( i++ ))
done <<< $ words
```

here string

everything to the right of a pipe | → executed in a subshell

<(grep d /usr/share/dict/words) - a process treated like a file

! can mask the error codes/ret codes

! can match the error codes/ret codes
