04.Command Substitution

Sunday, March 15, 2026 3:38 PM

mv - when given multiple arg, it will move all files into the last provided argument

! mv * dir/ - error if the dir/ is inside the current directory but still moves everything into dir/

var = 'comm' var is the string comm
var = `comm` var is the command

echo `echo `whoami`` ! not nested

this is how they are nested

echo ` echo \` whoami \`` nested

echo ` echo \` echo \\\` whoami \\\` \`

Other way to do this (simpler)

echo $(echo $(echo $(whoami)))

Functions can modify global var, but as soon as they have finished, their modifications will be deleted

$(func) the func is deleted as soon as it ends (it was run in a subshell)

func the function's modif are permanent

{ _ func ; } captures the function's output while still running in the main shell (no subshell ran)
