read -p "text" var displays the text and reads a prompt from the terminal and stores it in var

ctrl+c exit a command

yes output 'y' a bunch of times - useful to pipeline to a piece of software that asks for a lot of confirmations

marks the start of a comment

var = $1 the variable takes the first provided argument (if exists)

If statement

```
if cond ; then
    body
else
    body
fi
```

[[-n $1]] condition to check if the argument is set

"$@" an array that expands as long as there are arguments
