05.Arithmetic Expression

Sunday, March 15, 2026 3:38 PM

57 ** 2 <=> 57^2

Math expressions understand variables → $(($a + $b)) <=> $((a + b))

! When a var cannot be parsed into math → treated as 0

((i++)) ((i *= 10))
((i >>= 5)) ((i <<= 5)) bitwise shift l/r
((max = a > b ? a : b)) ternary operations

! Math expressions have return codes like normal functions

! If the result of a math expression is 0, then it is returning 1 (it is considered a failure) (and a failure in bash returns a code different from 0)

set -e exit on failure

a=07

echo $a \\07

echo $((a)) \\7 → but treated as being in base 8

echo $((10#$a)) force it into base 10
