read -r → do not allow backslash to escape any characters

→ only reads the first line

To read a whole document → while read -r line;

! If the body is empty, then bash will consider it an error

→ It can be used : or true to 'fill' it

while read line; reads until it finds a newline char. If it does not find it, the data is lost. A way to escape this is || [[-n $ line]] which tests if the line variable has some data on it

program < file tele the program to read from a file
